

Lunar Reconnaissance Orbiter (LRO) Navigation Overview

May 21, 2008

Rivers Lamb

Who am I?

- Guy with the weird name
- Born and raised in North Carolina
- Grew up with Star Wars and Star Trek
- Really wanted to be a professional goalkeeper, but...
- Graduated from Virginia Tech in Aerospace Engineering in 2003
- Started as a co-op in Flight Dynamics Analysis Branch in 2001
- Primary experience in mission design and maneuver planning
 - Mission design for Solar Dynamics Observatory (SDO)
 - Re-entry planning for Tropical Rainfall Measurement Mission (TRMM)
 - Launch and early operations support for Aura
 - Mission design and maneuver planning for Space Technology 5 (ST5)
- Currently Flight Dynamics Ground System Lead for LRO
 - Responsible for the maneuver planning and navigation support
- Please ask questions!

LRO Objectives

Objective: The Lunar Reconnaissance Orbiter (LRO) mission objective is to conduct investigations that will be specifically targeted to prepare for and support future human exploration of the Moon.

Locate Potential Resources

- Hydrogen/water at the lunar poles
- Continuous solar energy
- Mineralogy

Safe Landing Sites

- High resolution imagery
- Global geodetic grid
- Topography
- Rock abundances

Space Environment

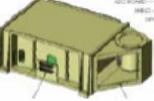

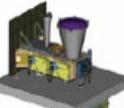

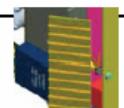

- Energetic particles
- Neutrons

Science Instruments

INSTRUMENT	SPONSORSHIP	MEASUREMENT	LVL 1 RQMTS TRACEABILITY
CRaTER Cosmic Ray Telescope for the Effects of Radiation	 PI: Harlan Spence, BU IM: Rick Foster, MIT ISE: Bob Goeke, MIT	<i>Tissue equivalent response to radiation LET energetic particle spectra 200 keV – 1 GeV/nuc</i>	M10 - Radiation Environment M20 - Radiation on Human-equivalent tissue
DLRE Diviner Lunar Radiometer Experiment	 PI: David Paige, UCLA IM: Wayne Hartford, JPL ISE: Marc Foote, JPL	<i>Better than 500m scale maps of temperature, rock abundances, mineralogy</i>	M50 - Surface Temperatures M80 - Surface Features and Hazards M90 - Polar Illumination M100 - Regolith Resources
LAMP Lyman-Alpha Mapping Project	 PI: Alan Stern, SwRI IM: Ron Black, SwRI ISE: Dave Slater, SwRI	<i>UV Albedo maps of the permanently shadowed areas Maps of frosts in permanently shadowed areas, 3km resolution</i>	M60 - Images of PSRs M70 - Subsurface Ice
LEND Lunar Exploration Neutron Detector	 PI: Igor Mitrofanov, IKI Deputy PI: Roald Sagdeev, UMD IM: Anton Sanin, IKI ISE: Maxim Litvak, IKI	<i>Maps of hydrogen in upper 2m of Moon at 10km scales Global distribution of neutrons around the Moon</i>	M10 - Radiation Environment M70 - Subsurface Ice M110 - Hydrogen Mapping
LOLA Lunar Orbiter Laser Altimeter	 PI: David Smith, GSFC Co-PI: Maria Zuber, MIT IM: Glenn Jackson, GSFC ISE: John Cavanaugh, GSFC	<i>~50m scale polar topography at <10cm vertical, and roughness and slope data</i>	M30 - Topography Grid M40 - Topography Resolution M60 - Images of PSRs M80 - Surface Features and Hazards M90 - Polar Illumination
LROC Lunar Reconnaissance Orbiter Camera	 PI: Mark Robinson, ASU IM: Scott Brylow, MSSS ISE: Mike Caplinger, MSSS	<i>1000s² of 50cm/pixel images (125km), and entire Moon at 100m visible, 400m UV</i>	M40 - Topography Resolution M80 - Surface Features and Hazards M90 - Polar Illumination M100 - Regolith Sources
Mini-RF Technology Demonstration	 POC: Keith Raney, JHU/APL PM: Bill Marinelli, NAWC DPM: Dean Huebert, NAWC	<i>X&S-band Radar imaging and radiometry</i>	P160 - Demonstrate new lightweight SAR Technologies

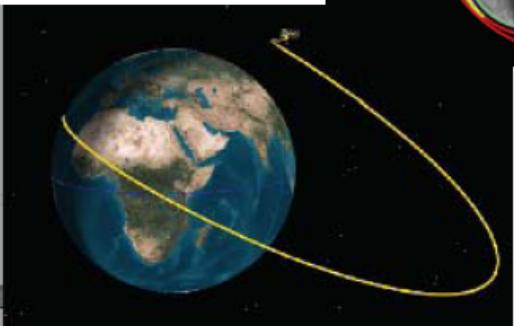

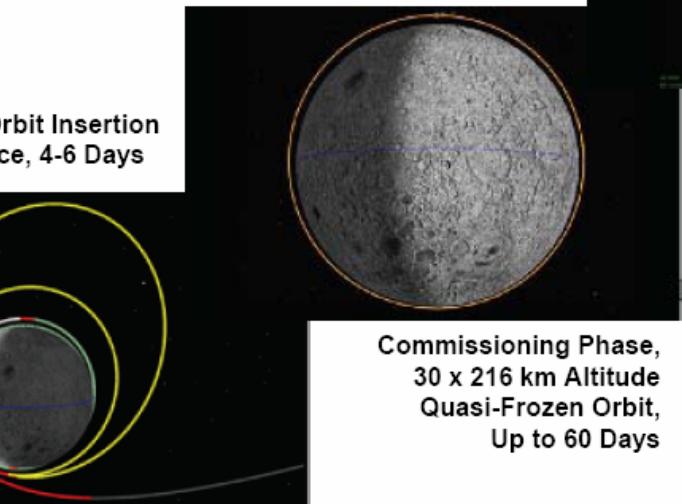

LRO Mission Timeline

Minimum Energy
Lunar Transfer ~ 4 Days

Lunar Orbit Insertion
Sequence, 4-6 Days

Commissioning Phase,
30 x 216 km Altitude
Quasi-Frozen Orbit,
Up to 60 Days

Polar Mapping Phase,
50 km Altitude Circular Orbit,
At least 1 Year

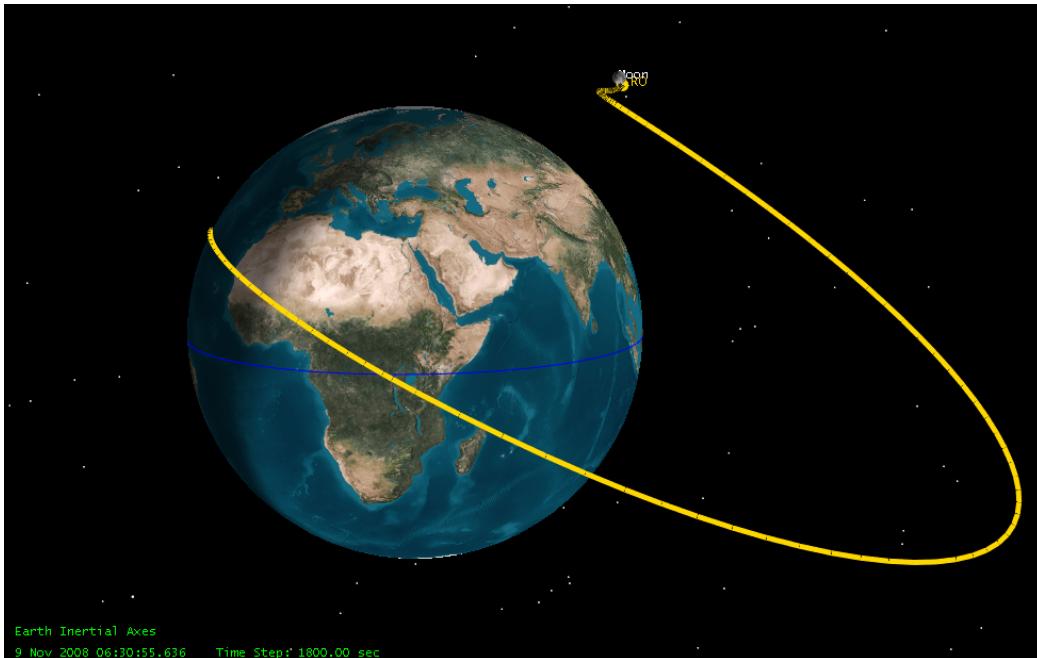

Trajectory Overview – Launch and Cruise

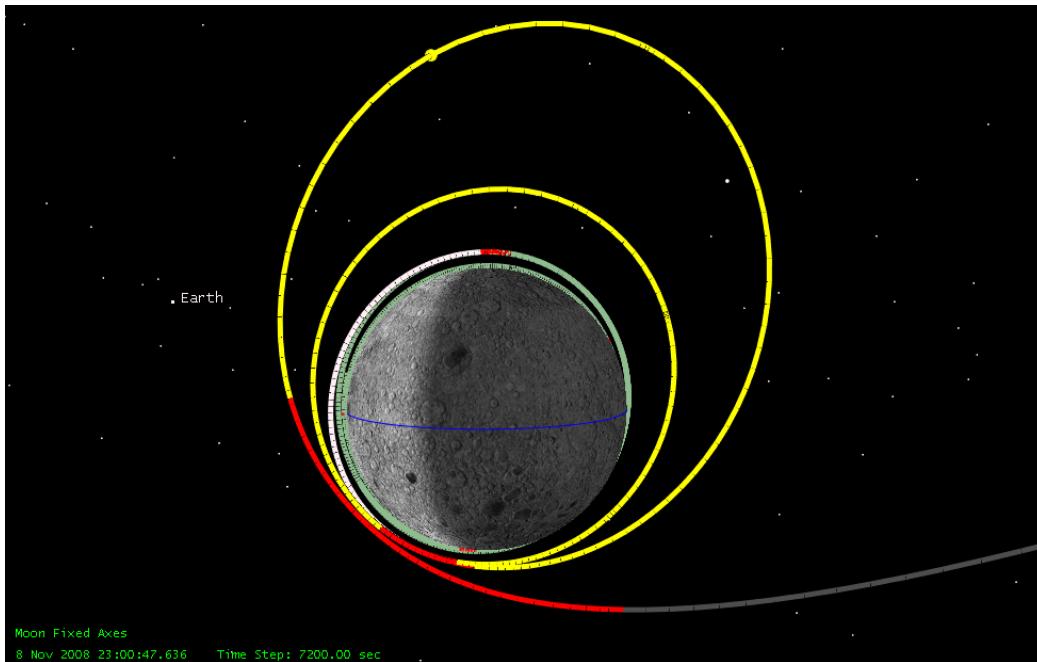

- LRO is scheduled to launch in late 2008 on Atlas V with LCROSS
- Direct transfer to moon is 4-5 days
- Two planned maneuvers correct for launch dispersions
 - MCC-E at Separation + 22 hours
 - MCC-1 at Separation + 24 hours

Trajectory Overview – Lunar Orbit Insertion

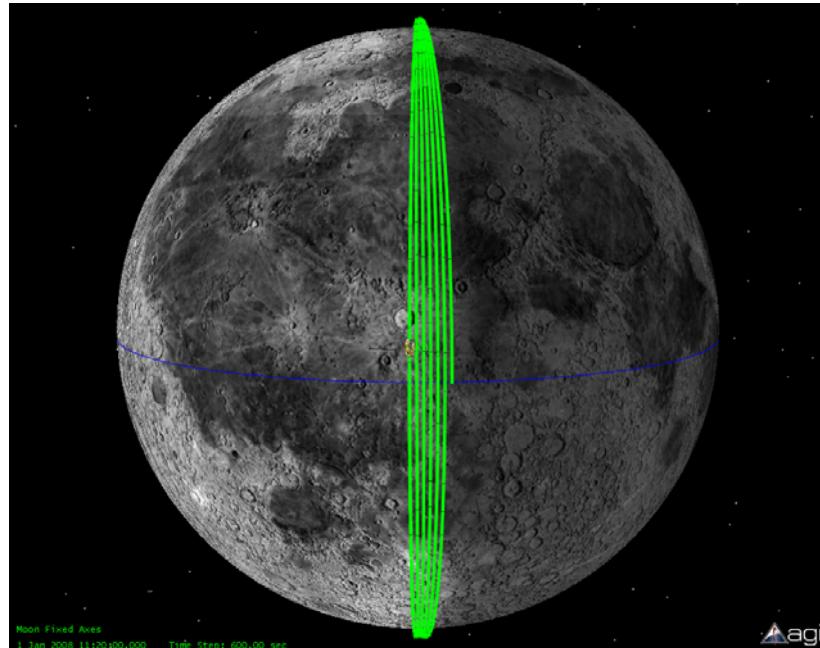

- Lunar Orbit Insertion (LOI) maneuver sequence (over 4-5 days)
 - LOI-1 captures into polar lunar orbit with 5 hour period
 - Total of 5 LOI maneuvers achieves Commissioning Orbit (26 x 216 km)
- Commissioning Orbit (up to sixty days)
 - No orbit maintenance maneuvers needed

Trajectory Overview – Mission Orbit Insertion

- Mission Orbit Insertion (MOI) maneuver sequence
 - Total of 3 maneuvers achieves Mission Orbit ($50 \text{ km} \pm 20 \text{ km}$ altitude)
- Mission Orbit (one year)
 - One pair of stationkeeping (SK) maneuvers every 27 days km
 - Momentum management maneuvers executed once every two weeks

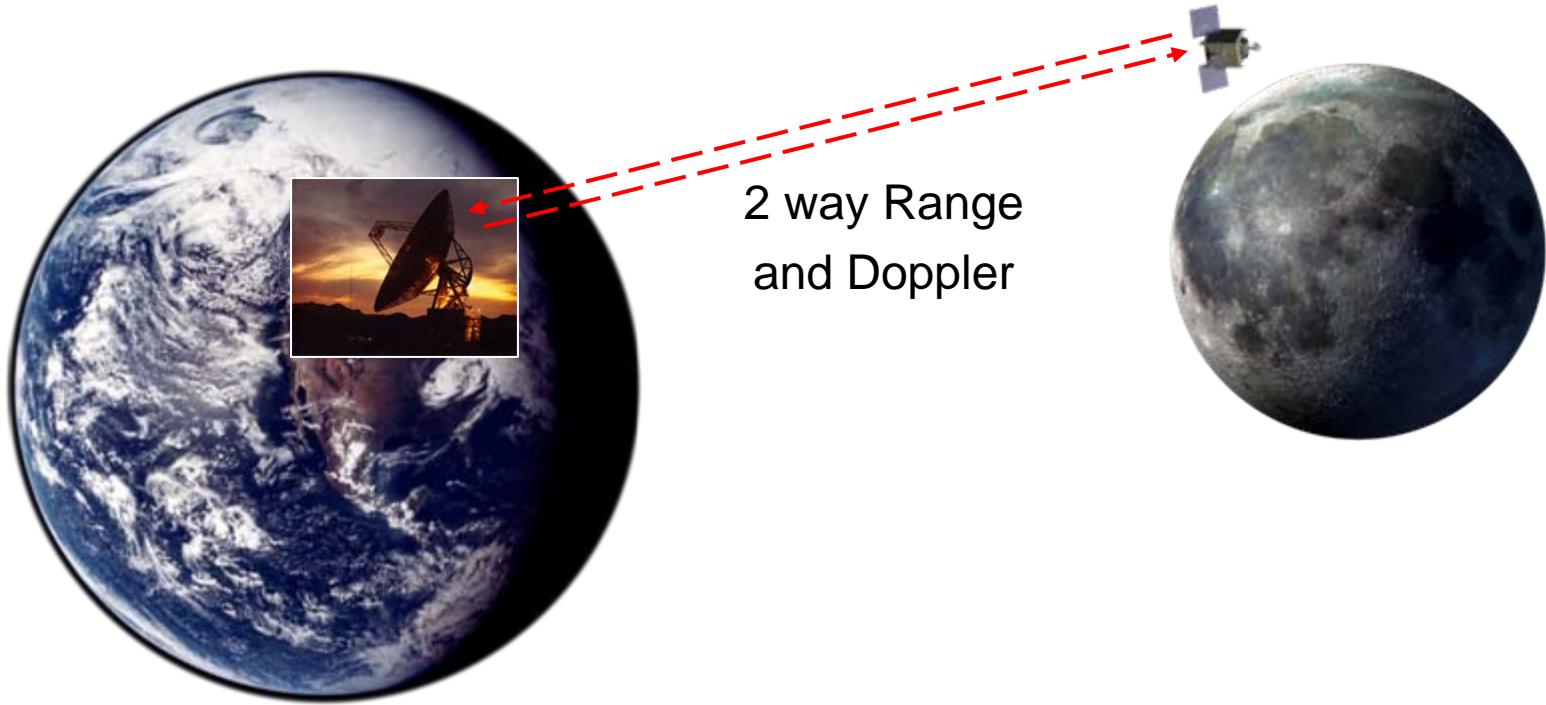

Communications Overview

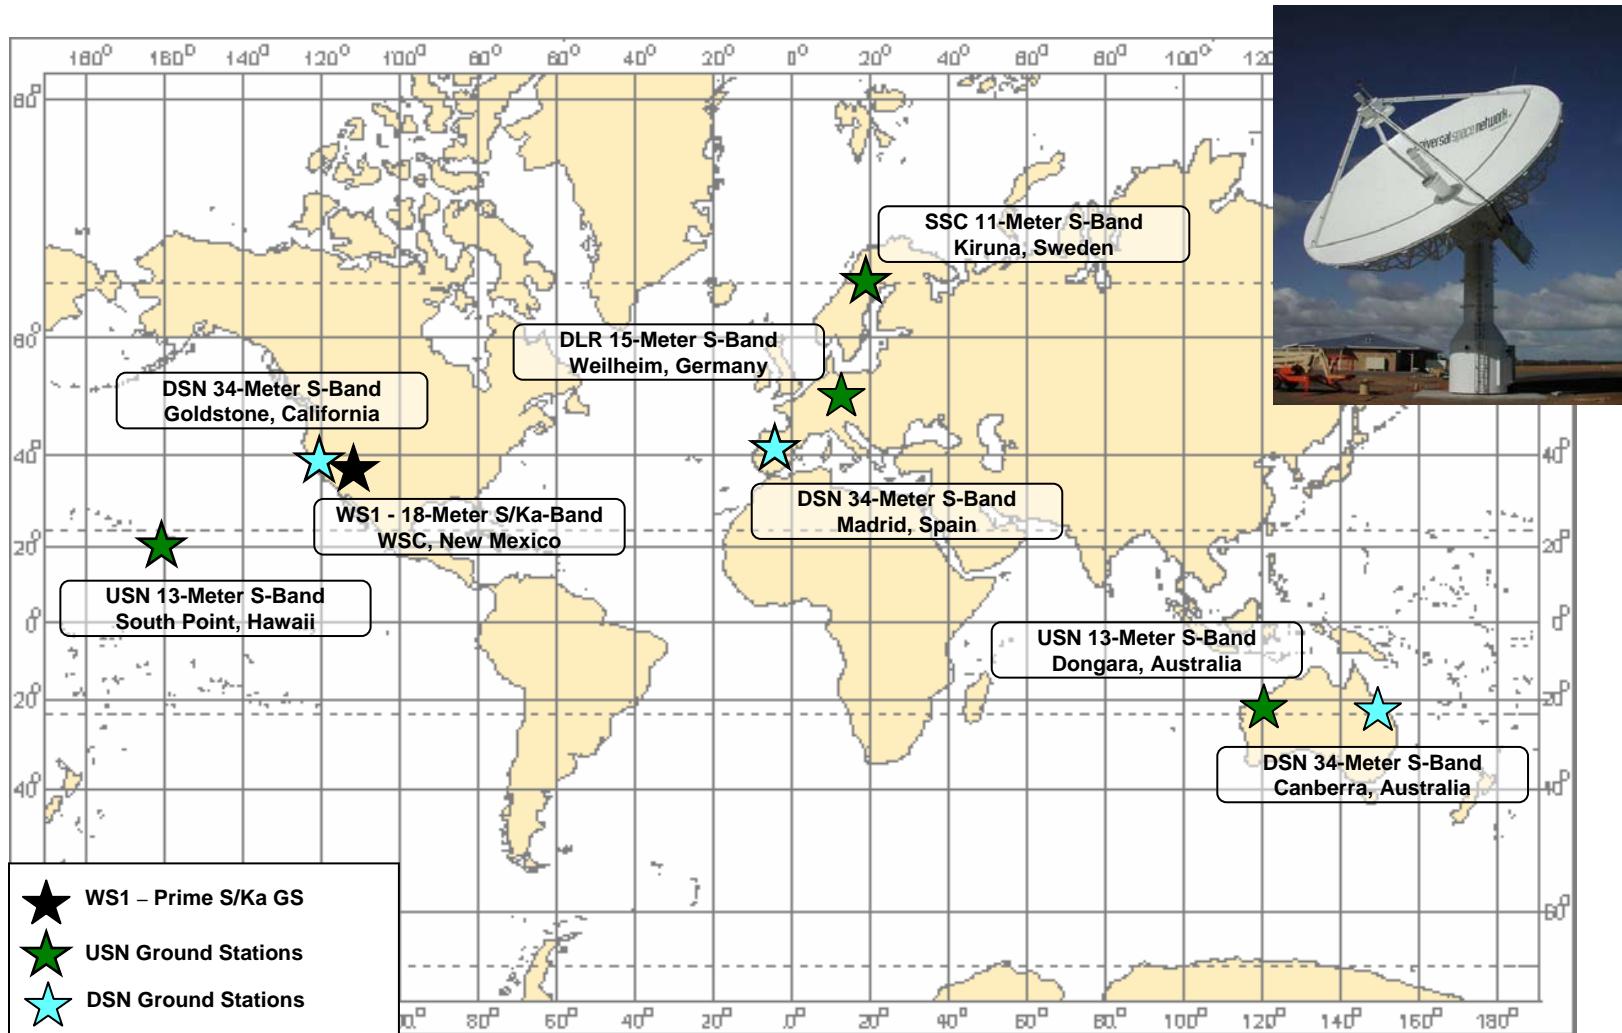

- Tracking, Telemetry, and Command functions are provided through ground-based S-band communication
- Range requirement of 10 m; Doppler requirement of 1 or 3 mm/s

Ground Stations

Flight Dynamics Facility

- Range and Doppler measurements are sent to the Flight Dynamics Facility (FDF)
- FDF is an institutional GSFC facility
- Secured operational control center
- Supports ELVs, ISS, STS, other spacecraft
- Primary navigation and mission design for past two US lunar missions: Clementine and Lunar Prospector
- Primary support for LRO:
 - Tracking Data Evaluation
 - Orbit Determination
 - Mission Product Generation
 - Mission Design
 - Maneuver Planning
- The Goddard Trajectory Determination System (GTDS) is used for LRO orbit determination

Daily Navigation Support for LRO

- Requirements on S-band Tracking Data Provided to FDF
 - SCN required to provide 30 minutes of tracking data every lunar orbit
 - Coherent Doppler and range measurements
 - Range accuracy 10 meters (1 sigma)
 - WS1 and DSN Doppler accuracy 1 mm/s (1 sigma)
 - Other S-band stations Doppler accuracy 3 mm/s (1 sigma)
- Orbit Determination Requirements
 - Daily OD using S-band tracking data
 - Predictive ephemeris requirement in lunar orbit is 800 m after 84 hours
 - Definitive ephemeris is 500 m RSS and 18 m radial
 - Post-maneuver OD using S-band tracking data
 - No predictive or definitive accuracy requirements
 - Primary goal is to update station acquisition data and MOC products

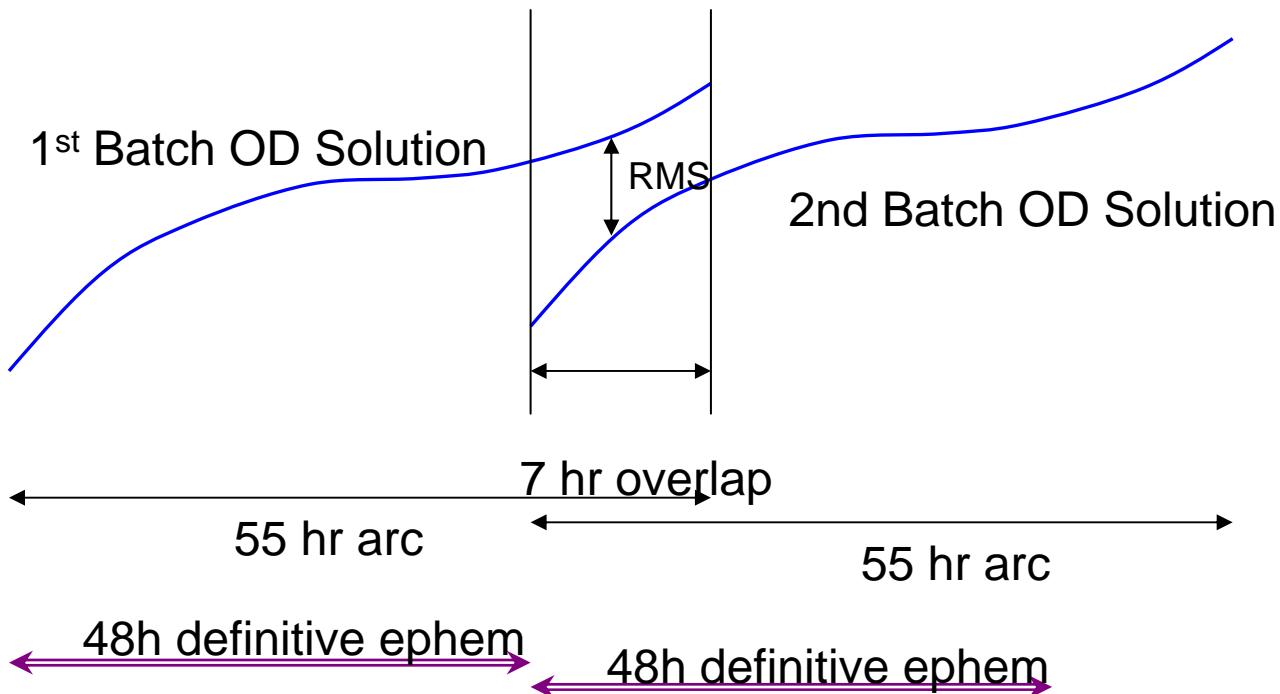

Lunar Prospector Results

- Reprocessed LP data shows overlap compares to 60 m RSS (1-sigma) and 6 m radial (1-sigma) – meets requirement!

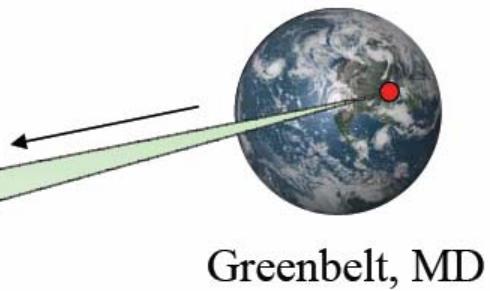

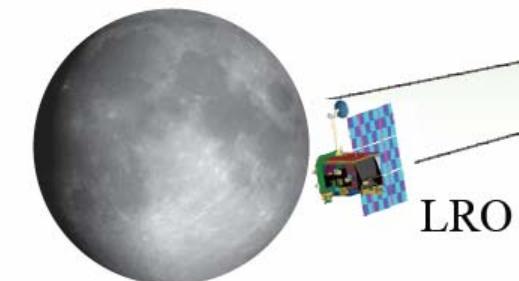

One-Way Laser Ranging

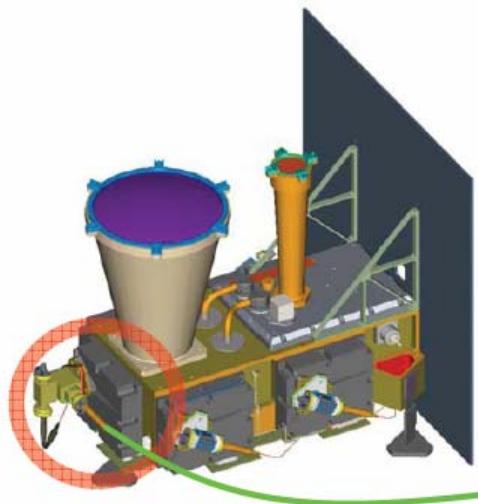

- Transmit 532nm laser pulses at 28 Hz to LRO
- Time stamp Departure and Arrival times

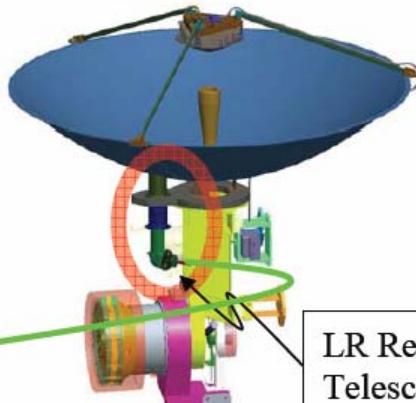

Greenbelt, MD

Receiver telescope on High Gain Antenna System (HGAS) routes LR signal to LOLA

LOLA channel 1
Detects LR signal

Fiber Optic Bundle

LR Receiver Telescope

OD Reprocessing Using Laser Data

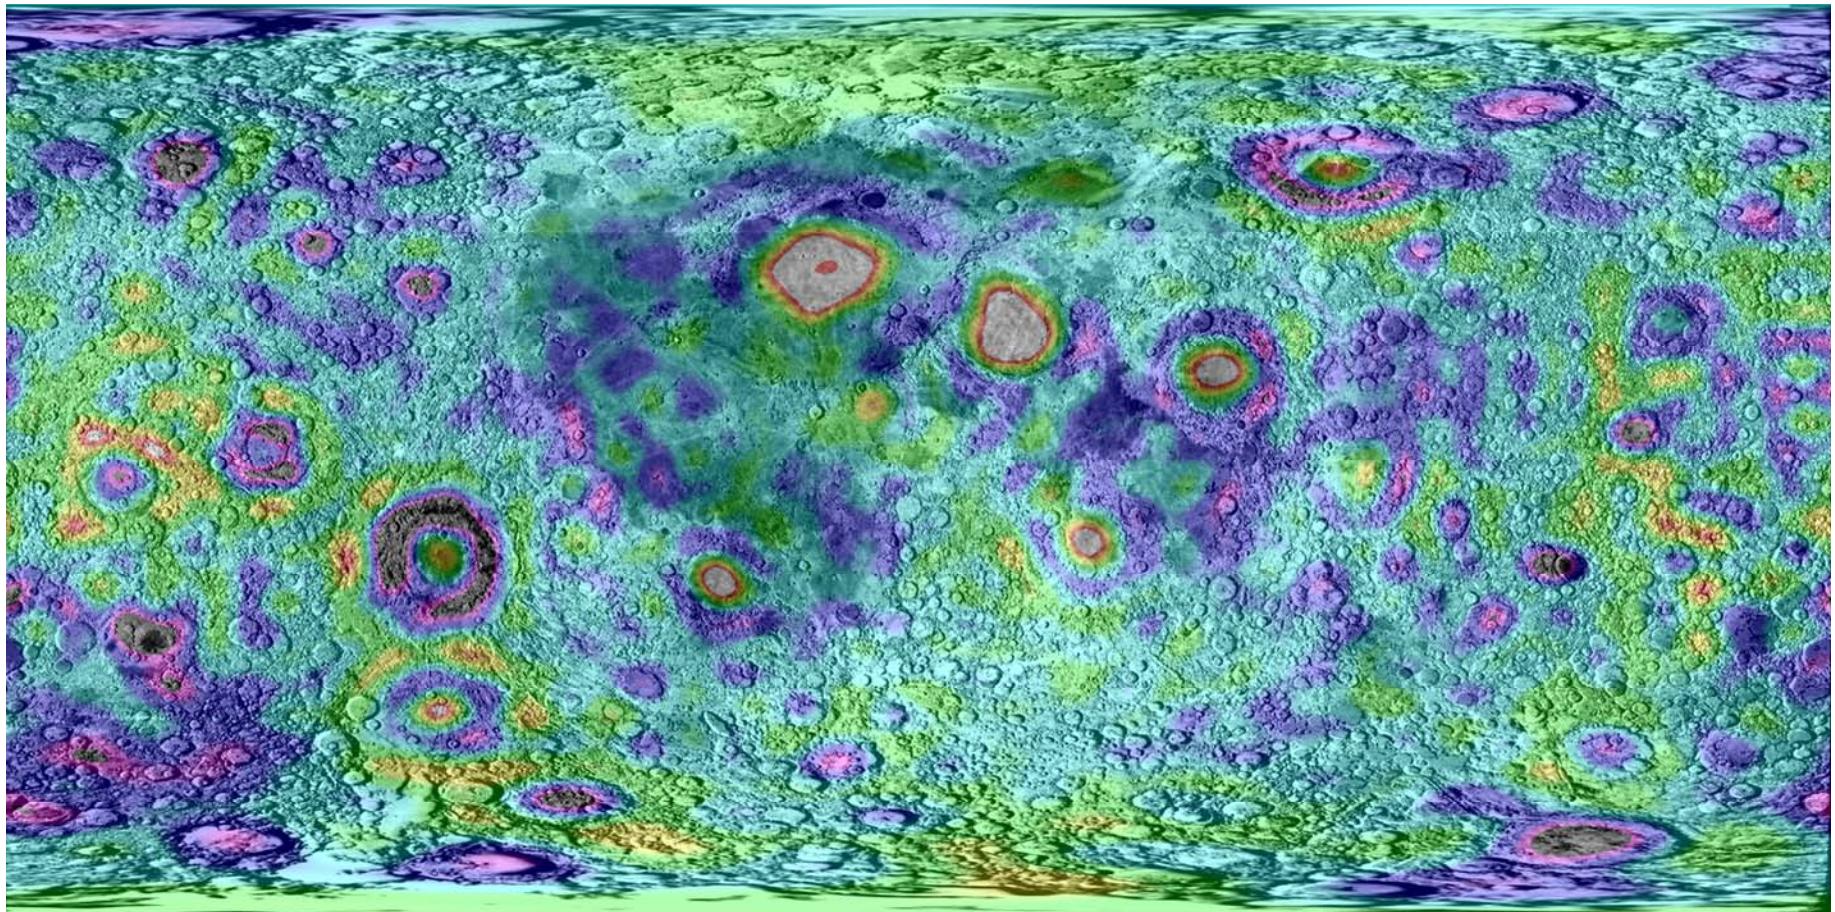

- Goal: Orbit accuracy of 50 m RSS and 1 m radial
- Reprocessing of definitive OD using S-band and laser tracking data
 - Performed twice during mission: at L+3 months, end of nominal mission
 - Uses updated lunar gravity model provided by LR team
- Key force model upgrades to improve accuracy
 - Gravity modeling (biggest error source)
 - Solar and lunar radiation modeling
 - Lunar solid tide accelerations due to the Earth and Sun on the Moon

Accelerations due to Lunar Gravity

Lunar Gravity Impact on Mission Orbit

Conclusion

- LRO will provide the most accurate map of the Moon yet!
